Exp No: 08 a) NMAP TO DISCOVER LIVE HOSTS USING NMAP SCANS ON THE TRY HACKME PLATFORM

Aim:

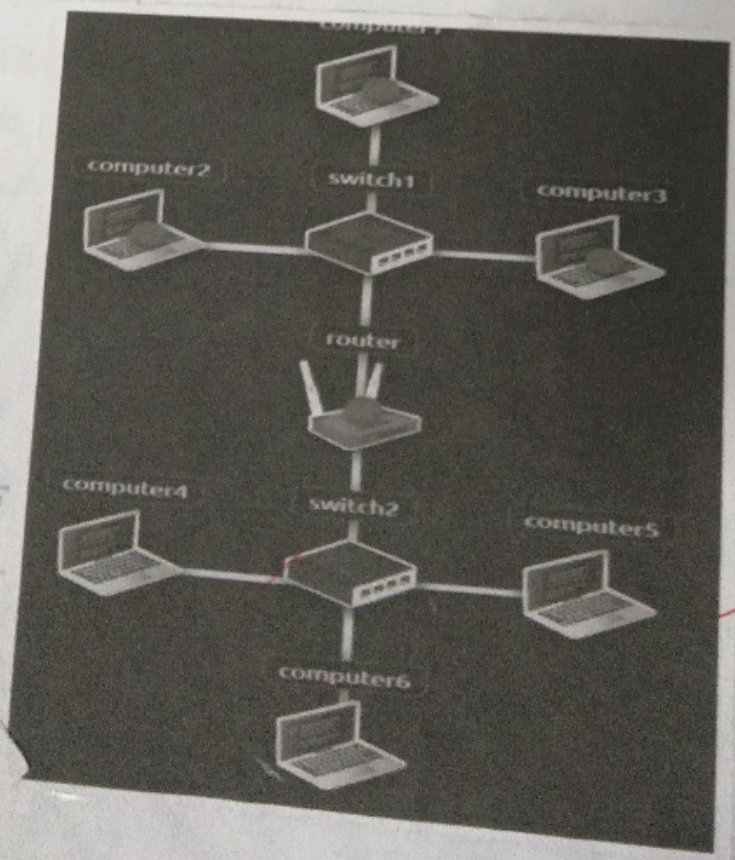

To discover live hosts using Nmap scans (ARP, ICMP, TCP/UDP) on the TryHackme platform

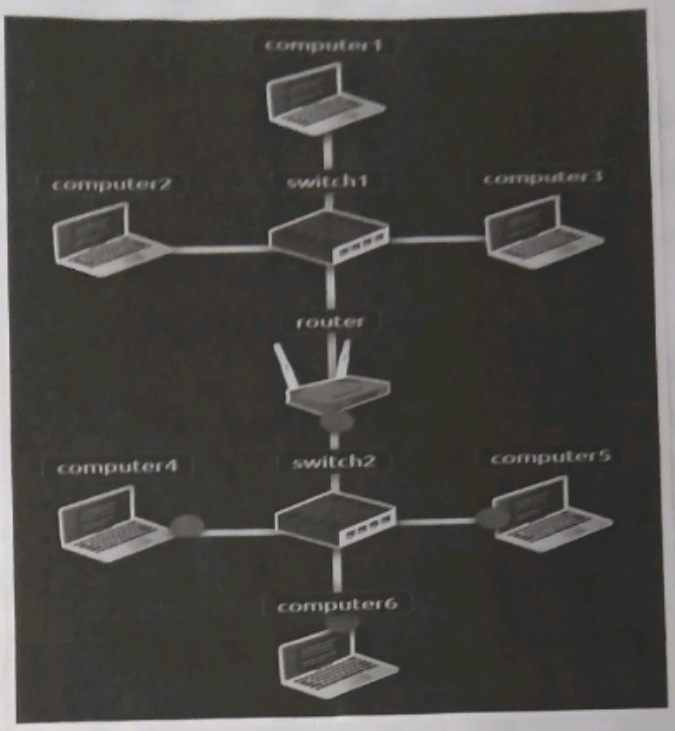

Introduction:

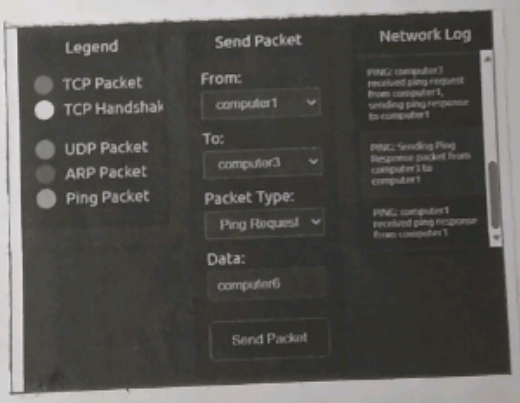

When targetting a network we need an efficient tool to handle repetitive tasks. This tool should help us find out which systems are active and what services are running on those systems

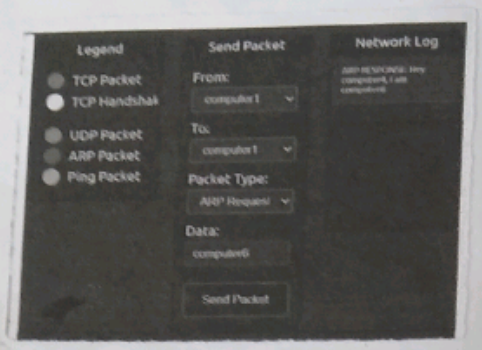

This room is the first of four in this Nmap series. These four rooms are also part of the Network security module.

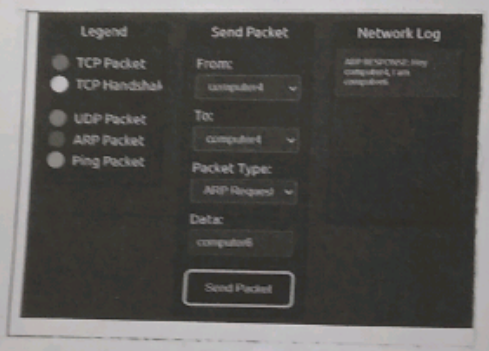

Nmap live Host Discovery
Nmap Basic Port Scans
Nmap Advanced port scans
Nmap post port Scans

computer3
Packet Type:
Ping Request
Data:
computer6
Send Packet
Network Log

Result:

Thus live hosts are successfully identified using Nmap ARP scanning.

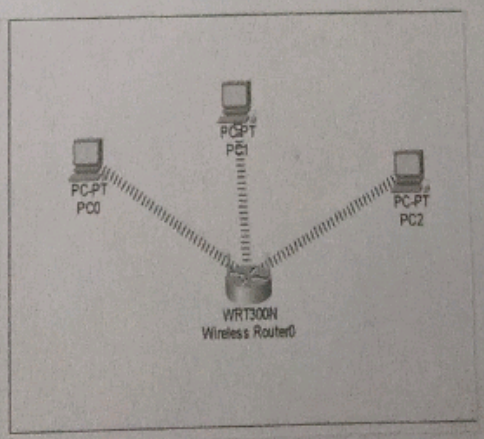

b) CONFIGIORATION OF WLAN USING CISCO PACKET TRACER

Aim:
To configure a wireless LAN using cisco packet tracker and establish wireless communicatim between computers through a wireless router.

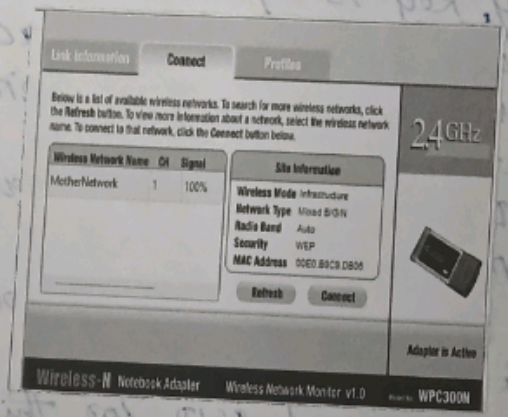

STEPS:

1. SSID is the name used to identify a wireless network
2. Security key is a password used to protect the wireless network from unauthorized access.
3. Wireless LAN connects device wirelessly using a wireless router or access point
4. Static IP address is manually assigned to each device for network communicatim
5. WEP is a wireless security protocol used to protect the network
6. The configured SSID for this experiment is mother Network
7. The WEP key used is 0123456789.

TOPOLOGY:

Output:

Result:

Thus, a secure wireless LAN was successfully configured using cisco packet Tracer, and all three PCs were connected to the wireless router.
